The Addressable Matrix system uses flexible, fibre optic light guides to illuminate areas on a floor plan, laid over a high-resolution grid.

This unique system dispenses completely with wiring and enables indicators to be moved, removed or added on site without the need for any wiring.

Ideal for buildings such as hospitals where the building layout may evolve over a period. As the building changes, so too can Syncro Matrix, with very little cost or disruption.

The addressable Matrix can be supplied with or without common LEDs and controls. Optional LEDs indicate Power On, Fire, Fault and Disarm and optional controls are for Alarm Silence, Buzzer Silence, Lamp Test and Reset.

It provides a clear, geographical indication of the fire alarm or other system activation enabling speedy identification of the source of an alarm or other events.

Addressable Fire Alarm Panels

The ethos of Morley-IAS is to supply products approved to meet local legislation. In the UK, all of Morley IAS's fire detection and alarm control panels are designed to meet EN54 Part 2 and Part 4 standards and are approved by the LPCB to ensure compliance. The carefully planned evolution of their products over many years ensures that they can provide a panel to maintain or extend existing Morley-IAS fire systems, and a system purchased today meets not only your existing needs but can easily grow to satisfy the requirements of tomorrow.

Voice System

The Fire-Cryer Plus voice enhanced sounder has been developed to counteract the ever-increasing problem of audible alarms being ignored. It eliminates any potential confusion by combining the normal sounder signal with a clear and unambiguous voice message. Fire-Cryer Plus products require no special wiring and can be retrofitted to existing installations. They are fully synchronised and have an exceptionally low current consumption allowing simple replacement of existing sounders and bells.

PA/VA System

VX-3000 SERIES

The issue of security is more important than ever. Our VX-3000 Series is a reliable and energy-saving voice alarm system that combines all important functions for VA/PA in one unit frame. The limited number of components makes the design and installation much easier, as well as saving space and reducing cable complexity. This enables rapid system configuration and makes the VX-3000 a cost effective system.

Thanks to its flexible and scalable system architecture the VX-3000 system can be used for both small and large applications, with up to 256 remote microphones and 128 audio sources.

System Features

- Compact: All functions, all inputs and outputs in one unit
- Cost effective: Easy system configuration thanks to a small number of system components
- Flexible: Broadcast of many different audio signals simultaneously, flexible speaker driving from 1 zone per amplifier up to 64 zones per amplifier
- Scalable: up to 320 remote microphones
- Light-weight: Modern supply switching technology and digital amplifiers
- 1024 audio messages
- Energy saving: Standby mode for low power consumption during battery backup reduces the required battery capacity
- Decentralized: IP Network based
- Advanced ambient noise control (ANC)
- Masterless system provides high security if one line fails

Beam & Flame Detection

FIRERAY Optical Beam Smoke Detectors are an efficient and economical way of providing "wide area" smoke detection. They are usually used in situations where it is impractical, inappropriate or not cost effective (installation, wiring and maintenance) to use traditional point-type detectors and they also enable coverage of a large area at minimal cost.

FIRERAY 5000

The Fireray® 5000 motorised reflective, auto aligning infrared optical beam smoke detector can be installed with up to two detector heads per system, thus saving on installation time and costs. In addition, each system controller houses two pairs of fire and fault relays, one per detector.

All 3 main types of Talentum Flame Detectors, IR2, IR3 and UV/IR2 have similar performance when it comes to detecting flames, but each has its own 'specialist' use for which it is best suited. Each type of Flame Detector can detect a flame from any source apart from Magnesium and Subpar which can be detected with special versions of the Flame Detectors. The Flame Detectors have a Fire and a Fault relay and need a flickering flame to activate.

Beam Detection

thefirebeam™

Two main attributes make The Fire Beam stand out from the crowd. A motorised beam head that continually self-aligns, and a low level controller from which all major functions can be performed. By utilising motors within the beam head The Fire Beam can make commissioning a safer and more accurate procedure. High quality stepper motors allows micro adjustments of just 1/40 of 1 degree to the beam head. Controlled by software, this finds and continually monitors its position in relation to the reflector. This ensures that you achieve perfect alignment every time and that your beam will keep that alignment.

OSID by Xtralis provides reliable, cost-effective smoke detection for open spaces where fire detection presents unique challenges and where very early warning is not always the priority. Open-area Smoke Imaging Detection (OSID) is a new innovation in projected beam smoke detection technology. By using advanced dual wavelength projected beams and optical imaging technology for early warning smoke detection, OSID provides a low-cost, reliable and easy-to-install solution that overcomes typical beam detection issues such as false alarm incidents and alignment difficulties.

Osid can support up to 7 emitters with a maximum range of 150m per unit, connected to a single Imager making it easier to deploy in unusually shaped areas. Emitters can be placed at different heights to overcome stratification and provide earlier detection

Refuge Systems

The Sigtel range of refuge systems comprises of two wall-mounting master controllers, the ECU-4, and ECU-8 which can handle 4 and 8 lines respectively, and an eight line expansion unit, the ECU-8S. Typically located in a building's control room or fire services access point, the ECU-4 and ECU-8 allow management and/or the fire services to communicate via a telephone-style handset with the system's 'outstations'. Two types of outstation are available (Type A and Type B). Type B outstations offer true hands-free duplex speech and allow anyone in a refuge area to communicate with building control at the touch of a button. Type A telephone-style outstations are designed for use in stadium marshalling systems and other emergency evacuation applications. Comprising a telephone handset in a push-to-open or key lockable red steel cabinet.

Hearing Loop Systems

Audio-frequency induction loop systems (AFILS) allow hearing impaired people to hear more clearly. Hearing aids with the 'T' or 'MT' switch are able to pick up the electromagnetic field generated by an induction loop system and this signal is converted into a sound suited to the user's hearing requirements. Any person with a suitable hearing aid positioned within or near the loop can hear the loop signal, allowing them to participate more easily in conversation, ordering goods or services, listening to public performances, etc.

Scorpion Detector Test Equipment

Scorpion is the solution for buildings with hard-to-access detectors. Suitable for both Point and Aspirating Smoke Detection (ASD) systems, Scorpion ensures all smoke detectors can be tested – regardless of location.

The Scorpion head unit is permanently installed adjacent to a point detector or sampling hole on an Aspirating Smoke Detection pipe (typically the furthest sampling hole). The smoke generator is connected to an access point mounted at a convenient, easy to access location at ground level. Functional testing of the detector is then easily and safely achieved by connecting a portable controller (carried by the engineer) to the access point.

Emergency Lighting

Emergency Lighting is a primary life safety system and is required, where necessary, to be provided in premises where people are employed in order to assist the occupants to evacuate in the event of an emergency. If artificial light is installed in a workplace then emergency lighting is a mandatory requirement. Emergency Lighting should cover the following aspects: General, Escape Route, Open Area (anti-panic), Standby Lighting, and High Risk Task Area lighting.

Our range of lighting has been selected to give a broad range of luminaires to cover most common applications, and with a range of spares to assist with on-going maintenance.
